I Believe Bizarro Critter - Batticator

The Batticator, also known as *Crocodylus Cattus Vespertilio*, is found in the swamplands of Louisiana. It was first discovered on Friday, October 13th 1946. The Batticator is a very intelligent, cunning creature.

This animal has grey webbed alligator feet, along with a grey alligator body and tail. It has a grey siamese cat head and face. It has the grey wings of a bat.

Studies have shown that the Batticator can live 16 years on average. Its diet usually includes fish, insects, and small birds. It also can survive in many different climates.

It can survive in many ecosystems, and those that live in cooler climates hibernate, so to speak. In the warmer habitats the Batticators stay active year-round. Batticators can deal with the weather from Antarctica to the weather in Jamaica.

They have become very well adapted, considering they were only discovered 70 years ago. It has been found all over the world since that day in 1946. There is still more to be found.
